

DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

S

LABORATORY MANUAL FOR OPERATING SYSTEM LAB

BRANCH – CSE

NAME OF FACULTY - SMT RAJSHREE SENAPATI

Semester – 4th

Sl. No.	CONTENT	Page No.
01	To study and execute the commands in Unix.	1-7
02	To study the various commands operated in vi editor in UNIX.	8-13
03	To study about the Unix Shell Programming Commands.	14-21
04	Write a Shell script to print the command line arguments in reverse order.	22
05	Write a Shell script to check whether the given number is palindrome or not.	23
06	Write a Shell script to sort the given array elements in ascending order using bubble sort.	24-25
07	Write a Shell script to perform sequential search on a given array elements.	26
08	Write a Shell script to perform binary search on a given array elements.	27-28
09	Write a Shell script to accept any two file names and check their file permissions.	29-30
10	Write a Shell script to read a path name, create each element in that path e.g: a/b/c i.e., 'a' is directory in the current working directory, under 'a' create 'b', under 'b' create 'c'.	31
11	Write a Shell script to illustrate the case- statement.	32
12	Write a Shell script to accept the file name as	33

	arguments and create another shell script, which	
	recreates these files with its original contents.	
13	Write a Shell script to demonstrate Terminal locking.	34
14	Write a Shell script to accept the valid login name, if the login name is valid then print its home directory else an appropriate message.	35
15	Write a Shell script to read a file name and change the existing file permissions.	36
16	Write a Shell script to print current month calendar and to replace the current day number by '*' or '**' respectively.	37
17	Write a Shell Script to display a menu consisting of options to display disk space, the current users logged in, total memory usage, etc. (using functions.)	38-39
18	Write a C-program to fork a child process and execute the given Linux commands.	40
19	Write a C-program to fork a child process, print owner process ID and its parent process ID.	41
20	Write a C-program to prompt the user for the name of the environment variable, check its validity and print an appropriate message.	42
21	Write a C-program to READ details of N students such as student name, reg number, semester and age. Find the eldest of them and display his details.	43-44

UNIX COMMANDS

AIM :

To study and execute the commands in Unix.

COMMAND:

1. Date Command:

This command is used to display the current data and time.

Syntax:

\$date

\$date +%ch

Options: -

a = Abbreviated weekday.

A = Full weekday.

- b = Abbreviated month.
- B = Full month.
- c = Current day and time.
- C = Display the century as a decimal number.
- d = Day of the month.
- D = Day in ,,mm/dd/yy" format
- h = Abbreviated month day.
- H = Display the hour.
- L = Day of the year.
- m = Month of the year.
- M = Minute.
- P = Display AM or PM
- S = Seconds
- T = HH:MM:SS format
- u = Week of the year.
- y = Display the year in 2 digit.
- Y = Display the full year.
- Z = Time zone.

To change the format :

Syntax :

\$date ,,+%H-%M-%S"

2. Calender Command:

This command is used to display the calendar of the year or the particular month of calendar year.

Syntax:

a.\$cal <year>

b.\$cal <month> <year>

Here the first syntax gives the entire calendar for given year & the second Syntax gives the calendar of reserved month of that year.

3. Echo Command:

This command is used to print the arguments on the screen .

Syntax:

\$echo <text>

Multi line echo command:

To have the output in the same line, the following commands can be used.

Syntax:

\$echo <text\>text

To have the output in different line, the following command can be used.

Syntax:

\$echo "text

>line2

>line3"

4. Banner Command:

It is used to display the arguments in ,,#" symbol.

Syntax:

\$banner <arguments>

5.'who' Command:

It is used to display who are the users connected to our computer currently.

Syntax:

\$who-option"s

Options: -

H–Display the output with headers.

b-Display the last booting date or time or when the system was lastly rebooted.

2

6.'who am i' Command:

Display the details of the current working directory.

Syntax:

\$who am i

7.'tty' Command:

It will display the terminal name.

Syntax:

\$tty

8.'Binary' Calculator Command:

It will change the "\$" mode and in the new mode, arithematic operations such as +,-,*,/,%,n,sqrt(),length(),=, etc can be performed. This command is used to go to the binary calculus mode.

Syntax:

\$bc operations

^d

\$

1 base -- input base

0 base – output base are used for base conversions.

Base:

Decimal = 1 Binary = 2 Octal = 8 Hexa = 16

9.'CLEAR' Command:

It is used to clear the screen.

Syntax:

\$clear

10.'MAN' Command:

It helps us to know about the particular command and its options & working. It is like "help"

command in windows.

Syntax:

\$man <command name>

11. MANIPULATION Command:

It is used to manipulate the screen.

Syntax:

\$tput <argument>

Arguments:

1. Clear - to clear the screen.

2. Longname – Display the complete name of the terminal.

- 3. SMSO background become white and foreground become black color.
- 4. Rmso background become black and foreground becomes white color.
- 5. Cop R C Move to the cursor position to the specified location.
- 6. Cols Display the number of columns in our terminals.
- 12. LIST Command:
- It is used to list all the contents in the current working directory.

Syntax:

- \$ ls options <arguments>
- If the command does not contain any argument means it is working in the Current directory.

Options:

- a-used to list all the files including the hidden files.
- c-list all the files column wise.
- d- list all the directories.
- m-list the files separated by commas.
- p- list files include ,,/" to all the directories.
- r-list the files in reverse alphabetical order.
- f- list the files based on the list modification date.
- x-list in column wise sorted order.

DIRECTORY RELATED COMMANDS:

1. Present Working Directory Command:

To print the complete path of the current working directory.

Syntax:

\$pwd

2. MKDIR Command:

To create or make a new directory in a current directory .

Syntax:

\$mkdir <directory name>

3. CD Command:

To change or move the directory to the mentioned directory .

Syntax:

\$cd <directory name.

4. RMDIR Command:

To remove a directory in the current directory & not the current directory itself.

Syntax:

\$rmdir <directory name>

FILE RELATED COMMANDS:

1. CREATE A FILE:

To create a new file in the current directory we use CAT command.

Syntax:

\$cat > <filename.

The > symbol is redirectory we use cat command.

2. DISPLAY A FILE:

To display the content of file mentioned we use CAT command without ">" operator.

Syntax:

\$cat <filename.

Options

-s = to neglect the warning / error message.

3. COPYING CONTENTS:

To copy the content of one file with another. If file does not exist, a new file is created and if the file exists with some data then it is overwritten.

Syntax:

\$ cat <filename source> >> <destination filename>

\$ cat <source filename> >> <destination filename> it is avoid overwriting.

Options : -

-n content of file with numbers included with blank lines.

Syntax:

\$cat -n <filename>

4. SORTING A FILE:

To sort the contents in alphabetical order in reverse order.

Syntax:

\$sort <filename >

Option:

\$ sort -r <filename>

5. COPYING CONTENTS FROM ONE FILE TO ANOTHER:

To copy the contents from source to destination file. So that both contents are same.

Syntax:

\$cp <source filename> <destination filename>

\$cp <source filename path > <destination filename path>

6. MOVE Command:

To completely move the contents from source file to destination file and to remove the source

file.

Syntax:

\$ mv <source filename> <destination filename>

7. REMOVE Command:

To permanently remove the file we use this command.

Syntax:

\$rm <filename>

8. WORD Command:

To list the content count of no of lines, words, characters.

Syntax:

\$wc<filename>

Options:

-c - to display no of characters.

-l - to display only the lines.

-w - to display the no of words.

9. LINE PRINTER:

To print the line through the printer, we use lp command.

Syntax:

\$lp <filename>

10. PAGE Command:

This command is used to display the contents of the file page wise & next page can be viewed by pressing the enter key.

Syntax:

\$pg <filename>

11. FILTERS AND PIPES

HEAD: It is used to display the top ten lines of file.

Syntax: \$head<filename>

TAIL: This command is used to display the last ten lines of file.

Syntax: \$tail<filename>

PAGE: This command shows the page by page a screen full of information is displayed after which the page command displays a prompt and passes for the user to strike the enter key to continue scrolling.

Syntax:

\$ls −a\p

MORE: It also displays the file page by page .To continue scrolling with more command, press the space bar key.

Syntax:

\$more<filename>

GREP: This command is used to search and print the specified patterns from the file.

Syntax:

\$grep [option] pattern <filename>

SORT: This command is used to sort the datas in some order.

Syntax: \$sort<filename>

PIPE: It is a mechanism by which the output of one command can be channeled into the input of another command.

Syntax:

\$who | wc-l

Vi EDITOR COMMANDS

AIM:

To study the various commands operated in vi editor in UNIX.

DESCRIPTION:

The Vi editor is a visual editor used to create and edit text, files, documents and programs. It displays the content of files on the screen and allows a user to add, delete or change part of text . There are three modes available in the Vi editor , they are

1. Command mode

2. Input (or) insert mode.

Starting Vi:

The Vi editor is invoked by giving the following commands in UNIX prompt.

Syntax:

\$vi <filename> (or)

\$vi

This command would open a display screen with 25 lines and with tilt (~) symbol at the start of each line. The first syntax would save the file in the filename mentioned and for the next the filename must be mentioned at the end.

Options:

1. vi +n <filename> - this would point at the nth line (cursor pos).

2. vi –n <filename> - This command is to make the file to read only to change from one mode to another press escape key.

INSERTING AND REPLACING COMMANDS:

To move editor from command node to edit mode, you have to press the <ESC> key.

For inserting and replacing the following commands are used.

1. ESC a Command:

This command is used to move the edit mode and start to append after the current character.

Syntax:

<ESC> a

2. ESC A COMMAND:

This command is also used to append the file, but this command append at the end of current line.

Syntax:

< ESC > A

3. ESC i Command:

This command is used to insert the text before the current cursor position.

Syntax:

<ESC> i

4. ESC I Command:

This command is used to insert at the beginning of the current line.

Syntax:

<ESC> I

5. ESC o Command:

This command is insert a blank line below the current line & allow insertion of contents.

Syntax:

<ESC> o

6. ESC O Command:

This command is used to insert a blank line above & allow insertion of contents.

Syntax:

<ESC> O

7. ESC r Command:

This command is to replace the particular character with the given characters.

Syntax:

<ESC> rx Where x is the new character.

8. ESC R Command:

This command is used to replace the particular text with a given text.

Syntax:

<ESC> R text

9. <ESC> s Command:

This command replaces a single character with a group of character .

Syntax:

<ESC> s

10. <ESC> S Command:

This command is used to replace a current line with group of characters.

Syntax:

<ESC> S

9]-

CURSOR MOVEMENT IN Vi:

1. <ESC> h:

This command is used to move to the previous character typed. It is used to move to left of the text . It can also used to move character by character (or) a number of characters.

Syntax:

 $\langle ESC \rangle$ h – to move one character to left.

<ESC> nh – to move "n" character to left.

2. <ESC> l:

This command is used to move to the right of the cursor (ie) to the next character. It can also be used to move the cursor for a number of characters.

Syntax:

<ESC>1-single character to right.

<ESC> nl - ,,n" characters to right.

3. <ESC> j:

This command is used to move down a single line or a number of lines.

Syntax:

<ESC> j – single down movement.

<ESC> nj – "n" times down movement.

4. <ESC> k:

This command is used to move up a single line or a number of lines.

Syntax:

 $\langle ESC \rangle$ k – single line above.

<ESC> nk - ,,n" lines above.

5. ENTER (OR) N ENTERS:

This command will move the cursor to the starting of next lines or a group of lines mentioned.

Syntax:

<ESC> enter <ESC> n enter.

6. <ESC> + Command:

This command is used to move to the beginning of the next line.

Syntax:

<ESC> + <ESC> n+

7.<ESC> - Command :

This command is used to move to the beginning of the previous line.

Syntax:

 $\langle ESC \rangle$ - $\langle ESC \rangle$ n8. $\langle ESC \rangle$ 0 :

This command will bring the cursor to the beginning of the same current line.

Syntax:

<ESC> 0

9. <ESC> \$:

This command will bring the cursor to the end of the current line.

Syntax:

<ESC>\$

10. <ESC> ^:

This command is used to move to first character of first lines.

Syntax:

<ESC> ^

11. <ESC> b Command:

This command is used to move back to the previous word (or) a number of words.

Syntax:

<ESC> b <ESC>nb

12. <ESC> e Command:

This command is used to move towards and replace the cursor at last character of the word

(or) no of words.

Syntax:

<ESC> e <ESC>ne

13. <ESC> w Command:

This command is used to move forward by a single word or a group of words.

Syntax:

<ESC> w <ESC> nw

DELETING THE TEXT FROM Vi:

1. <ESC> x Command:

To delete a character to right of current cursor positions, this command is used.

Syntax:

<ESC> x <ESC> nx

2. <ESC> X Command:

To delete a character to left of current cursor positions, this command is used.

Syntax:

<ESC> X <ESC> nX

3. <ESC> dw Command:

This command is to delete a single word or number of words to right of current cursor position.

Syntax:

<ESC> dw <ESC> ndw

4. db Command:

This command is to delete a single word to the left of the current cursor position.

Syntax:

<ESC> db <ESC> ndb

5. <ESC> dd Command:

This command is used to delete the current line (or) a number of lines below the current line.

Syntax:

<ESC> dd <ESC> ndd

6. <ESC> d\$ Command:

This command is used to delete the text from current cursor position to last character of current line.

Syntax:

<ESC> d\$

SAVING AND QUITING FROM Vi:-

1. <ESC> w Command:

To save the given text present in the file.

Syntax:

<ESC> : w

2. <ESC> q! Command:

To quit the given text without saving.

Syntax:

<ESC> :q!

3. <ESC> wq Command:

This command quits the vi editor after saving the text in the mentioned file.

Syntax:

<ESC> :wq

4. <ESC> x Command:

This command is same as "wq" command it saves and quit.

Syntax:

 $\langle ESC \rangle : x$

5. <ESC> q Command:

This command would quit the window but it would ask for again to save the file.

Syntax:

<ESC> : q

UNIX SHELL PROGRAMMING COMMANDS.

AIM:

To study about the Unix Shell Programming Commands.

INTRODUCTION:

Shell programming is a group of commands grouped together under single filename. After logging onto the system a prompt for input appears which is generated by a Command String Interpreter program called the shell. The shell interprets the input, takes appropriate action, and finally prompts for more input. The shell can be used either interactively - enter commands at the command prompt, or as an interpreter to execute a shell script. Shell scripts are dynamically interpreted, NOT compiled. Common Shells. C-Shell - csh : The default on teaching systems Good for interactive systems Inferior programmable features Bourne Shell - bsh or sh - also restricted shell - bsh : Sophisticated pattern matching and file name substitution Korn Shell : Backwards compatible with Bourne Shell Regular expression substitution emacs editing mode Thomas C-Shell - tcsh : Based on C-Shell Additional ability to use emacs to edit the command line Word completion & spelling correction Identifying your shell.

01. SHELL KEYWORDS:

echo, read, if fi, else, case, esac, for , while , do , done, until , set, unset, readonly, shift, export, break, continue, exit, return, trap , wait, eval ,exec, ulimit , umask.

02. General things SHELL

The shbang line The "shbang" line is the very first line of the script and lets the kernel know what shell will be interpreting the lines in the script. The shbang line consists of a #! followed by the full pathname to the shell, and can be followed by options to control the behavior of the shell.

EXAMPLE

#!/bin/sh

Comments are descriptive material preceded by a # sign. They are in effect until the end of a line and can be started anywhere on the line.

EXAMPLE

this text is not

interpreted by the shell

Wildcards There are some characters that are evaluated by the shell in a special way. They are called shell met characters or "wildcards." These characters are neither numbers nor letters. For example, the *, ?, and [] are used for filename expansion. The \langle , \rangle , $2 \rangle$, $\rangle \rangle$, and | symbols are used for standard I/O redirection and pipes. To prevent these characters from being interpreted by the shell they must be quoted.

EXAMPLE

Filename expansion:
rm *; ls ??; cat file[1-3];
Quotes protect met character:
echo "How are you?"
03. SHELL VARIABLES:

Shell variables change during the execution of the program .The C Shell offers a command "Set" to assign a value to a variable.

For example:

% set myname= Fred

% set myname = "Fred Bloggs"

% set age=20

A \$ sign operator is used to recall the variable values.

For example:

% echo \$myname will display Fred Bloggs on the screen A @ sign can be used to assign the integer constant values.

For example:

% @myage=20 % @age1=10 % @age2=20 % @age=\$age1+\$age2 % echo \$age List variables % set programming_languages= (C LISP) % echo \$programming_languages C LISP % set files=*.* % set colors=(red blue green)

% echo \$colors[2]

blue

% set colors=(\$colors yellow)/add to list

Local variables Local variables are in scope for the current shell. When a script ends, they are no longer available; i.e., they go out of scope. Local variables are set and assigned values.

EXAMPLE

variable name=value name="John Doe"

x=5

Global variables Global variables are called environment variables. They are set for the currently running shell and any process spawned from that shell. They go out of scope when the script ends.

EXAMPLE

VARIABLE_NAME=value

export VARIABLE_NAME

PATH=/bin:/usr/bin:.

export PATH

Extracting values from variables To extract the value from variables, a dollar sign is used.

EXAMPLE

echo \$variable name echo \$name echo \$PATH

Rules: -

1. A variable name is any combination of alphabets, digits and an underscore (,,-,,);

2. No commas or blanks are allowed within a variable name.

3. The first character of a variable name must either be an alphabet or an underscore.

4. Variables names should be of any reasonable length.

5. Variables name are case sensitive. That is , Name, NAME, name, Name, are all different variables.

04. EXPRESSION Command:

To perform all arithmetic operations.

Syntax:

Var = ,,expr\$value1" + \$ value2"

Arithmetic The Bourne shell does not support arithmetic. UNIX/Linux commands must be used to perform calculations.

EXAMPLE

n=expr 5 + 5

echo \$n

Operators The Bourne shell uses the built-in test command operators to test numbers and strings.

EXAMPLE

Equality: = string != string -eq number -ne number Logical: -a and -o or ! not Logical: AND && OR || Relational: -gt greater than -ge greater than, equal to -lt less than -le less than, equal to Arithmetic : +, -, *, /, %

Arguments (positional parameters) Arguments can be passed to a script from the command line. Positional parameters are used to receive their values from within the script.

EXAMPLE

At the command line: \$ scriptname arg1 arg2 arg3 ... In a script: echo \$1 \$2 \$3 Positional parameters echo \$* All the positional parameters echo \$# The number of positional parameters

05. READ Statement:

To get the input from the user.

Syntax:

read x y

(no need of commas between variables)

06. ECHO Statement:

Similar to the output statement. To print output to the screen, the echo command is used. Wildcards must be escaped with either a backslash or matching quotes.

Syntax:

Echo "String" (or) echo \$ b(for variable).

EXAMPLE

echo "What is your name?"

Reading user input The read command takes a line of input from the user and assigns it to a variable(s) on the right-hand side. The read command can accept muliple variable names. Each variable will be assigned a word.

EXAMPLE

echo "What is your name?"

read name

read name1 name2 ...

6. CONDITIONAL STATEMENTS:

The if construct is followed by a command. If an expression is to be tested, it is enclosed in square brackets. The then keyword is placed after the closing parenthesis. An if must end with a fi.

Syntax:

1. if

This is used to check a condition and if it satisfies the condition if then does the next action, if not it goes to the else part.

2. If...else

Syntax:

If cp \$ source \$ target Then

Echo File copied successfully

Else

Echo Failed to copy the file.

3. nested if

here sequence of condition are checked and the corresponding performed accordingly.

Syntax:

if condition

then

command if condition then command else command fi fi 4. case esac This construct helps in execution of the shell script based on Choice. **EXAMPLE** The if construct is: if command then block of statements fi _____ if [expression] then block of statements fi _____ The if/else/else if construct is: if command then block of statements elif command then block of statements elif command then The case command construct is: case variable_name in pattern1) statements ;; pattern2) statements ;; pattern3) ;; *) default value ;; esac

case "\$color" in blue) echo \$color is blue ;; green) echo \$color is green ;; block of statements else block of statements fi _____ if [expression] then block of statements elif [expression] then block of statements elif [expression] then block of statements else block of statements fi ----red|orange) echo \$color is red or orange ;; *) echo "Not a color" # default esac The if/else construct is: if [expression] then block of statements else block of statements fi _____

07. LOOPS

There are three types of loops: while, until and for. The while loop is followed by a command or an expression enclosed in square brackets, a do keyword, a block of statements, and terminated with the done keyword. As long as the expression is true, the body of statements between do and done will be executed. The until loop is just like the while loop, except the body of the loop will be executed as long as the expression is false. The for loop used to iterate through a list of words, processing a word and then shifting it off, to process the next word. When all words have been shifted from the list, it ends. The for loop is followed by a variable name, the in keyword, and a list of words then a block of statements, and terminates with the done keyword.

The loop control commands are break and continue.

EXAMPLE

while command do block of statements done _____ while [expression] do block of statements done until command for variable in word1 word2 word3 ... do do block of statements block of statements done done _____ until [expression] do block of statements done _____ until control command do commands done **08. Break Statement:**

This command is used to jump out of the loop instantly, without waiting to get the control command.

09. ARRAYS (positional parameters)

The Bourne shell does support an array, but a word list can be created by using positional parameters. A list of words follows the built-in set command, and the words are accessed by position. Up to nine positions are allowed. The built-in shift command shifts off the first word on the left-hand side of the list. The individual words are accessed by position values starting at 1.

EXAMPLE

set word1 word2 word3 echo \$1 \$2 \$3 Displays word1, word2, and word3 set apples peaches plums shift Shifts off apples echo \$1 Displays first element of the list echo \$2 Displays second element of the list

echo \$* Displays all elements of the list

Command substitution To assign the output of a UNIX/Linux command to a variable, or use the output of a command in a string, backquotes are used.

EXAMPLE

variable_name=`command` echo \$variable_name now=`date` echo \$now echo "Today is `date`"

10. FILE TESTING

The Bourne shell uses the test command to evaluate conditional expressions and has a built-in set of options for testing attributes of files, such as whether it is a directory, a plain file (not a directory), a readable file, and so forth.

EXAMPLE

-d File is a directory -f File exists and is not a directory -r Current user can read the file -s File is of nonzero size -w Current user can write to the file -x Current user can execute the file #!/bin/sh 1 if [-f file] then echo file exists fi 2 if [-d file] then echo file is a directory fi 3 if [-s file] then echo file is not of zero length fi 4 if [-r file -a -w file] then echo file is readable and writable fi **11. EXECUTION OF SHELL SCRIPT:** 1. By using change mode command 2. $\$ chmod u + x sum.sh 3. \$ sum.sh or \$ sh sum.sh

Experiment 1:

Write a Shell script to print the command line arguments in reverse order.

Program:

```
#!/bin/sh
if [ $# -eq 00 ]
then
    echo "no arguments given"
    exit
fi
echo "Total number of arguments: $#"
echo "The arguments are: $*"
echo "The arguments in reverse order:"
rev=" "
for i in $*
do
    rev=$i" "$rev
done
echo $rev
```

Output 1

\$./print-arguments-in-reverse.sh no arguments given

Output 2

\$./print-arguments-in-reverse.sh 9 abc hello
Total number of arguments: 3
The arguments are: 9 abc hello
The arguments in reverse order:
hello abc 9

Experiment 2:

Write a Shell script to check whether the given number is palindrome or not.

Program:

echo enter n read n num=0 on=\$n while [\$n -gt 0] do num=\$(expr \$num * 10) k=\$(expr \$n % 10) num=\$(expr \$num + \$k) n=(expr n / 10)done if [\$num -eq \$on] then echo palindrome else echo not palindrome fi

Output:

\$ enter n \$ 121

\$ palindrome

Experiment 3:

Write a Shell script to sort the given array elements in ascending order using bubble sort.

Program:

```
#!/bin/bash
echo "enter maximum number"
read n
echo "enter Numbers in array:"
for ((i = 0; i < n; i++))
do
  read nos[$i]
done
echo "Numbers in an array are:"
for ((i = 0; i < n; i + ))
do
  echo ${nos[$i]}
done
for ((i = 0; i < n; i + ))
do
  for (( j = $i; j < $n; j++ ))
  do
    if [ \{nos[\$i]\} -gt \{nos[\$j]\} ]; then
    t={nos[$i]}
    nos[$i]=${nos[$j]}
    nos[$j]=$t
    fi
  done
done
echo -e "\nSorted Numbers "
for (( i=0; i < $n; i++ ))
do
  echo ${nos[$i]}
done
```

Output:

\$ bash bubblesort.sh Enter maximum number Enter Numbers in array: Numbers in an array are: Sorted Numbers

Experiment 4:

Write a Shell script to perform sequential search on a given array elements.

Program:

echo Enter the number of elements:

read n

echo Enter the array elements:

```
for (( i=1; i<=n; i++ ))
```

do

```
read a[$i]
```

done

echo Enter the element to be searched:

read item

j=1

```
while [ j - t - a - a - a
```

do

```
j=`expr $j + 1`
```

done

```
if [ $item -eq ${a[$j]} ]
```

then

echo \$item is present at location \$j

else

echo "\$item is not present in the array."

fi

Output:

Enter the number of elements: 5 Enter the array elements: 2 10 5 3 11 Enter the element to be searched: 5 5 is present at location 3

Experiment 5:

Write a Shell script to perform binary search on a given array elements.

Program:

```
echo "Enter the limit:"
read n
echo "Enter the numbers"
for(( i=0 ;i<n; i++ ))
do
read m
a[i]=$m
done
for(( i=1; i<n; i++ ))
do
for(( j=0; j<n-i; j++))
do
if [ \{a[\$j]\} -gt \{a[\$j+1]\} ]
then
t=\{a[$j]\}
a[\$j]{=}{a[\$j{+}1]}
a[$j+1]=$t
fi
done
done
echo "Sorted array is"
for(( i=0; i<n; i++ ))
do
echo "${a[$i]}"
done
echo "Enter the element to be searched :"
read s
1=0
c=0
u=$(($n-1))
while [ $1 -le $u ]
```

```
do
mid=$(((( $l+$u ))/2 ))
if [ $s -eq ${a[$mid]} ]
then
c=1
break
elif [ $s -lt ${a[$mid]} ]
then
u=$(($mid-1))
else
l=$(($mid+1))
fi
done
if [ $c -eq 1 ]
then
echo "Element found at position $(($mid+1))"
else
echo "Element not found"
fi
```

Output:

Enter the limit: 5 Enter the numbers 4 2 6 3 7 Sorted array is 2 3 4 6 7 Enter the element to be searched: 7 Element found at position 5

Experiment 6:

Write a Shell script to accept any two file names and check their file permissions.

Program:

#!/bin/bash # Check if two arguments are provided if [\$# -ne 2]; then echo "Usage: \$0 <file1> <file2>" exit 1 fi file1=\$1 file2=\$2 # Check if files exist if [! -e "\$file1"] || [! -e "\$file2"]; then echo "One or both files do not exist." exit 1 fi # Check file permissions for the first file echo "File permissions for \$file1:" if [-r "\$file1"]; then echo "Read permission is granted." else echo "Read permission is not granted." fi if [-w "\$file1"]; then echo "Write permission is granted." else echo "Write permission is not granted." fi if [-x "\$file1"]; then echo "Execute permission is granted." else echo "Execute permission is not granted." fi

echo "-----"

Check file permissions for the second file

echo "File permissions for \$file2:"

if [-r "\$file2"]; then

echo "Read permission is granted."

else

echo "Read permission is not granted."

fi

if [-w "\$file2"]; then

echo "Write permission is granted."

else

echo "Write permission is not granted."

fi

if [-x "\$file2"]; then

echo "Execute permission is granted."

else

echo "Execute permission is not granted."

fi

Output:

\$./check_permissions.sh file1.txt file2.txt
File permissions for file1.txt:
Read permission is granted.
Write permission is granted.
Execute permission is not granted.
File permissions for file2.txt:
Read permission is granted.

Write permission is not granted.

Execute permission is not granted.

Experiment 7:

Write a Shell script to read a path name, create each element in that path e.g: a/b/c i.e., 'a' is directory in the current working directory, under 'a' create 'b', under 'b' create 'c'.

Program:

```
#!/bin/bash
echo -n "Enter the path name: "
read path
if [ -z "$path" ]; then
  echo "Path is empty. Exiting."
  exit 1
fi
IFS='/' read -ra elements <<< "$path"
current dir="."
for element in "${elements[@]}"; do
  current_dir="$current_dir/$element"
  if [ -d "$current_dir" ]; then
     echo "Directory '$current_dir' already exists."
  else
     mkdir "$current_dir"
     echo "Created directory: $current_dir"
  fi
done
echo "Path creation complete."
```

Output:

\$./create_path.sh
Enter the path name: a/b/c
Created directory: ./a
Created directory: ./a/b
Created directory: ./a/b/c
Path creation complete.

Experiment 8:

Write a Shell script to illustrate the case-statement.

```
Program:
#!/bin/bash
# Prompt the user to enter a fruit name
echo -n "Enter a fruit name: "
read fruit
# Using case statement to check the fruit name
case $fruit in
  "apple")
     echo "You entered an apple. It's a red or green fruit."
     ;;
  "banana")
     echo "You entered a banana. It's a yellow fruit."
     ;;
  "orange" | "mandarin" | "clementine")
     echo "You entered an orange family fruit. It's typically orange in color."
     ;;
  "grape" | "kiwi")
     echo "You entered a grape or kiwi. These are small fruits."
     ;;
  *)
     echo "Unrecognized fruit."
     ;;
esac
Output:
```

\$./fruit_script.shEnter a fruit name: appleYou entered an apple. It's a red or green fruit.

Experiment 9:

Write a Shell script to accept the file name as arguments and create another shell script, which recreates these files with its original contents.

Program:

#!/bin/bash

Check if a file name is provided as an argument

```
if [ $# -eq 0 ]; then
```

echo "Usage: \$0 <filename>"

exit 1

fi

filename=\$1

Check if the file exists

```
if [ ! -e "$filename" ]; then
```

echo "File '\$filename' does not exist."

```
exit 1
```

fi

Generate the shell script to recreate the file

```
output_script="recreate_$filename.sh"
```

```
echo "#!/bin/bash" > "$output_script"
```

```
echo "" >> "$output_script"
```

```
echo "# Recreate file '$filename' with its original contents" >> "$output_script"
```

```
echo "cat <<'EOF' > \"$filename\"" >> "$output_script"
```

Append the original contents of the file to the script

```
cat "$filename" >> "$output_script"
```

echo "EOF" >> "\$output_script"

Make the generated script executable

chmod +x "\$output_script"

echo "Shell script to recreate '\$filename' has been generated: \$output_script"

Output:

cat <<'EOF' > "example.txt" Contents of the original file go here. Replace this with the actual content of 'example.txt'. EOF

Experiment 10:

Write a Shell script to demonstrate Terminal locking.

Program:

```
#!/bin/bash
stty -echo
while true
do
  clear
  echo "Enter the password:"
  read -s pass1 # -s flag for silent input, hiding characters
  echo "Re-enter the password:"
  read -s pass2
  if [[ "$pass1" == "$pass2" ]]; then
    echo "Terminal locked"
    echo "To unlock, enter the password"
    typed_pass=""
    while [ "$typed_pass" != "$pass2" ]
    do
       read -s typed_pass
    done
    echo "Terminal unlocked"
    stty echo # Re-enable terminal echo
    exit
  else
    echo "Password mismatch, please retype it"
    sleep 2 # Add a delay to make it more user-friendly
  fi
done
```

Output:

Enter the password: ******* Re-enter the password: ******* Terminal locked To unlock, enter the password *******

Terminal unlocked

Experiment 11:

Write a Shell script to accept the valid login name, if the login name is valid then print its home directory else an appropriate message.

Program:

#!/bin/bash
Prompt the user to enter a login name
echo -n "Enter a login name: "
read login_name
Check if the login name is valid
if [-z "\$login_name"]; then
 echo "Error: Login name cannot be empty."
 exit 1
fi
Get the home directory of the provided login name
home_directory=\$(getent passwd "\$login_name" | cut -d: -f6)
Check if the home directory exists

```
if [ -z "$home_directory" ]; then
```

echo "Error: Invalid login name or home directory not found for '\$login_name'."

else

echo "Home directory for '\$login_name': \$home_directory"

fi

Output:

./check_login.sh

Enter a login name: non_existent_user

Error: Invalid login name or home directory not found for 'non_existent_user'.

Experiment 12:

Write a Shell script to read a file name and change the existing file permissions.

Program:

#!/bin/bash echo -n "Enter a file name: " read filename if [-z "\$filename"]; then echo "Error: File name cannot be empty." exit 1 fi if [! -e "\$filename"]; then echo "Error: File '\$filename' does not exist." exit 1 fi echo "Current file permissions for '\$filename':" ls -l "\$filename" echo "-----" echo -n "Enter new file permissions (e.g., 644): " read new_permissions chmod "\$new_permissions" "\$filename" echo "Updated file permissions for '\$filename':" ls -l "\$filename"

Output:

Enter a file name: your_file.txt Current file permissions for 'your_file.txt': -rw-r--r-- 1 user user 1024 Jan 10 15:30 your_file.txt

Enter new file permissions (e.g., 644): 755 Updated file permissions for 'your_file.txt': -rwxr-xr-x 1 user user 1024 Jan 10 15:30 your_file.txt

Experiment 13:

Write a Shell script to print current month calendar and to replace the current day number by '*' or '**' respectively.

Program:

```
#!/bin/bash
# Get the current day number
current_day=$(date +"%d")
cal
echo "Replace the current day number with '*' or '**'"
echo -n "Enter '1' for '*' or '2' for '**': "
read choice
case $choice in
         cal | sed -e "s/\b$current_day\b/*/"
  1)
                                                  ;;
         cal | sed -e "s/\b$current_day\b/**/"
  2)
                                                       *)
                                                 ;;
     echo "Invalid choice. Exiting."
     exit 1
               ::
esac
```

Output:

Experiment 14:

Write a Shell Script to display a menu consisting of options to display disk space, the current users logged in, total memory usage, etc. (using functions.)

Program:

```
#!/bin/bash
# Function to display disk space
display_disk_space() {
  df -h
}
# Function to display currently logged-in users
display_logged_in_users() {
  who
}
# Function to display total memory usage
display_memory_usage() {
  free -h
}
# Main menu function
main_menu() {
  echo "==== Menu ===="
  echo "1. Display Disk Space"
  echo "2. Display Logged-in Users"
  echo "3. Display Memory Usage"
  echo "4. Exit"
  echo -n "Enter your choice (1-4): "
  read choice
  case $choice in
    1) display_disk_space ;;
    2) display_logged_in_users ;;
    3) display_memory_usage ;;
    4) echo "Exiting."
       exit 0 ::
                   *)
       echo "Invalid choice. Please enter a number between 1 and 4."
```

;;

esac

}

Main loop to keep displaying the menu

while true

do

main menu

done

Output:

==== Menu ==== 1. Display Disk Space 2. Display Logged-in Users 3. Display Memory Usage 4. Exit Enter your choice (1-4): 1 Filesystem Size Used Avail Use% Mounted on /dev/sda1 30G 10G 18G 36% / ==== Menu ==== 1. Display Disk Space 2. Display Logged-in Users 3. Display Memory Usage 4. Experiment 15:

Write a C-program to fork a child process and execute the given Linux commands.

Program:

```
#include <stdio.h>
```

- #include <stdlib.h>
- #include <unistd.h>

```
#include <sys/wait.h>
```

- int main() {
 - pid_t pid;

pid = fork();

if (pid < 0) {

perror("Fork failed");

exit(EXIT_FAILURE);

```
} else if (pid == 0) {
```

printf("Child process executing...\n");

```
execlp("ls", "ls", "-l", NULL);
```

```
perror("execlp failed");
```

exit(EXIT_FAILURE);

```
} else {
```

printf("Parent process waiting for the child...\n");

```
wait(NULL);
```

printf("Parent process exiting.\n");

```
}
```

return 0;

```
}
```

Output:

Parent process waiting for the child... Child process executing... total 12 -rwxr-xr-x 1 user user 8672 Jan 10 15:30 fork_exec Parent process exiting.

Experiment 16:

Write a C-program to fork a child process, print owner process ID and its parent process ID.

Program:

```
#include <stdio.h>
#include <unistd.h>
int main() {
  pid_t pid;
  pid = fork();
  if (pid < 0) {
     perror("Fork failed");
  } else if (pid == 0) {
     printf("Child process:\n");
     printf("PID: %d\n", getpid());
     printf("Parent PID: %d\n", getppid());
  } else {
     printf("Parent process:\n");
     printf("PID: %d\n", getpid());
     printf("Child PID: %d\n", pid);
  }
  return 0;
```

}

Output:

Parent process: PID: 1234 Child PID: 1235

Child process: PID: 1235 Parent PID: 1234

Experiment 17:

Write a C-program to prompt the user for the name of the environment variable, check its validity and print an appropriate message.

Program:

```
#include <stdio.h>
#include <stdib.h>
int main() {
    char var_name[50];
    printf("Enter the name of the environment variable: ");
    scanf("%s", var_name);
    char *var_value = getenv(var_name);
    if (var_value != NULL) {
        printf("The value of %s is: %s\n", var_name, var_value);
    } else {
        printf("Environment variable %s does not exist.\n", var_name);
    }
    return 0;
}
```

Output:

Enter the name of the environment variable: HOME

The value of HOME is: /home/your_username

Experiment 18:

Write a C-program to READ details of N students such as student name, reg number, semester and age. Find the eldest of them and display his details.

Program:

```
#include <stdio.h>
struct Student {
  char name[50];
  int regNumber;
  int semester;
  int age;
};
int main() {
  int n;
  printf("Enter the number of students: ");
  scanf("%d", &n);
  if (n \le 0) {
     printf("Invalid number of students. Exiting.\n");
     return 1;
  }
  struct Student students[n];
  for (int i = 0; i < n; i++) {
     printf("\nEnter details for student %d:\n", i + 1);
     printf("Name: ");
     scanf("%s", students[i].name);
     printf("Registration Number: ");
     scanf("%d", &students[i].regNumber);
     printf("Semester: ");
     scanf("%d", &students[i].semester);
     printf("Age: ");
     scanf("%d", &students[i].age);
  }
  int eldestIndex = 0;
  for (int i = 1; i < n; i++) {
     if (students[i].age > students[eldestIndex].age) {
```

```
eldestIndex = i;
}
printf("\nDetails of the eldest student:\n");
printf("Name: %s\n", students[eldestIndex].name);
printf("Registration Number: %d\n", students[eldestIndex].regNumber);
printf("Semester: %d\n", students[eldestIndex].semester);
printf("Age: %d\n", students[eldestIndex].age);
return 0;
```

}

Output:

Enter the number of students: 3

Enter details for student 1: Name: Alice Registration Number: 101 Semester: 2 Age: 20

Enter details for student 2: Name: Bob Registration Number: 102 Semester: 3 Age: 22

Enter details for student 3: Name: Charlie Registration Number: 103 Semester: 1 Age: 19

Details of the eldest student: Name: Bob Registration Number: 102 Semester: 3 Age: 22
